

The W5500 chip is a Hardwired TCP/IP embedded Ethernet controller that provides easier Internet connection to embedded systems. W5500 enables users to have the Internet connectivity in their applications just by using the single chip in which TCP/IP stack, 10/100 Ethernet MAC and PHY embedded.

WIZnet's Hardwired TCP/IP is the market-proven technology that supports TCP, UDP, IPv4, ICMP, ARP, IGMP, and PPPoE protocols. W5500 embeds the 32Kbyte internal memory buffer for the Ethernet packet processing. If you use W5500, you can implement the Ethernet application just by adding the simple socket program. It's faster and easier way rather than using any other Embedded Ethernet solution. Users can use 8 independent hardware sockets simultaneously.

W5500 is suitable for the following embedded applications:

- Home Network Devices: Set-Top Boxes, PVRs, Digital Media Adapters
- Serial-to-Ethernet: Access Controls, LED displays, Wireless AP relays, etc.
- Parallel-to-Ethernet: POS / Mini Printers, Copiers
- USB-to-Ethernet: Storage Devices, Network Printers
- GPIO-to-Ethernet: Home Network Sensors
- Security Systems: DVRs, Network Cameras, Kiosks
- Factory and Building Automations
- Medical Monitoring Equipment
- Embedded Servers

## 1.1 Pin Descriptions

Table 1. Pin Type Notation

I	Input
O	Output
I/O	Input / Output
A	Analog
PWR	3.3V power
GND	Ground

Table 2. W5500 Pin Description

1	TXN	-	AO	The differential data is transmitted to the media on the TXP/TXN signal pair.
2	TXP	-	AO	
3	AGND	-	GND	
4	AVDD	-	PWR	
5	RXN	-	AI	The differential data from the media is received on the RXP/RXN signal pair.
6	RXP	-	AI	
7	DNC	-	AI/O	
8	AVDD	-	PWR	
9	AGND	-	GND	
10	EXRES1	-	AI/O	It should be connected to an external resistor (12.4K $\Omega$ , 1%) needed for biasing of internal analog circuits. Refer to the 'External reference resistor' (Figure.2) for details.
11	AVDD	-	PWR	
12	-		-	
13	-		-	
14	AGND	-	GND	
15	AVDD	-	PWR	
16	AGND	-	GND	
17	AVDD	-	PWR	
18	VBG	-	AO	This pin will be measured as 1.2V at 25 $^{\circ}$ C. It must be left floating.
19	AGND	-	GND	
20	TOCAP	-	AO	This pin must be connected to a 4.7 $\mu$ F capacitor. The trace length to capacitor should be short to stabilize the internal signals.
21	AVDD	-	PWR	
22	1V2O	-	AO	

<sup>1</sup> Internal Bias after hardware reset

				<p>This pin must be connected to a 10nF capacitor.</p> <p>This is the output voltage of the internal regulator.</p>
23	RSVD	Pull-down	I	It must be tied to GND.
24	SPDLED	-	O	<p>This shows the Speed status of the connected link.</p> <p>Low: 100Mbps</p> <p>High: 10Mbps</p>
25	LINKLED	-	O	<p>This shows the Link status.</p> <p>Low: Link is established</p> <p>High: Link is not established</p>

The 12.4K (1%) Resistor should be connected between EXRES1 pin and analog ground (AGND) as below.

Figure 2. External reference resistor

The crystal reference schematic is shown as below.

Figure 3. Crystal reference schematic

## 2 HOST Interface

W5500 provides SPI (Serial Peripheral Interface) Bus Interface with 4 signals (SCSn, SCLK, MOSI, MISO) for external HOST interface, and operates as a SPI Slave.

The W5500 SPI can be connected to MCU as shown in Figure 4 and Figure 5 according to its operation mode (Variable Length Data / Fixed Length Data Mode) which will be explained in Chapter 2.3 and Chapter 2.4.

In Figure 4, SPI Bus can be shared with other SPI Devices. Since the SPI Bus is dedicated to W5500, SPI Bus cannot be shared with other SPI Devices. It is shown in Figure 5.

At the Variable Length Data mode (as shown in Figure 4), it is possible to share the SPI Bus with other SPI devices. However, at the Fixed Length Data mode (as shown in Figure 5), the SPI Bus is dedicated to W5500 and can't be shared with other devices.

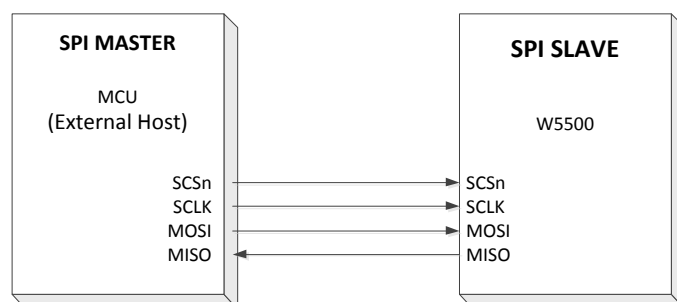

Figure 4. Variable Length Data Mode (SCSn controlled by the host)

Figure 5. Fixed Length Data Mode (SCSn is always connected by Ground)

The SPI protocol defines four modes for its operation (Mode 0, 1, 2, 3). Each mode differs according to the SCLK polarity and phase. The only difference between SPI Mode 0 and SPI Mode 3 is the polarity of the SCLK signal at the inactive state.

With SPI Mode 0 and 3, data is always latched in on the rising edge of SCLK and always output on the falling edge of SCLK.

The W5500 supports SPI Mode 0 and Mode 3. Both MOSI and MISO signals use transfer sequence from Most Significant Bit (MSB) to Least Significant Bit (LSB) when MOSI signal transmits and MISO signal receives. MOSI & MISO signals always transmit or receive in sequence from the Most Significant Bit (MSB) to Least Significant Bit (LSB).

Figure 6. SPI Mode 0 & 3

## 2.1 SPI Operation Mode

W5500 is controlled by SPI Frame (Refer to the Chapter 2.2 SPI Frame) which communicates with the External Host. W5500 SPI Frame consists 3 phases, Address Phase, Control Phase and Data Phase.

Address Phase specifies 16 bits Offset Address for W5500 Register or TX/RX Memory. Control Phase specifies the block to which Offset (set by Address Phase) belongs, and specifies Read/Write Access Mode and SPI Operation Mode (Variable Length Data / Fixed Length Data Mode).

And Data Phase specifies random length (N-bytes, 1 ~ N) Data or 1 byte, 2 bytes and 4 bytes Data.

If SPI Operation Mode is set as Variable Length Data Mode (VDM), SPI Bus Signal SCSn must be controlled by the External Host with SPI Frame step.

At the Variable Length Data Mode, SCSn Control Start (Assert (High-to-Low)) informs W5500 of SPI Frame Start (Address Phase), and SCSn Control End (De-assert (Low-to-High)) informs W5500 of SPI Frame End (Data Phase End of random N byte).

## 2.2 SPI Frame

W5500 SPI Frame consists of 16bits Offset Address in Address Phase, 8bits Control Phase and N bytes Data Phase as shown in Figure 7.

The 8bits Control Phase is reconfigured with Block Select bits (BSB[4:0]), Read/Write Access Mode bit (RWB) and SPI Operation Mode (OM[1:0]).

Block Select bits select the block to which the Offset Address belongs.

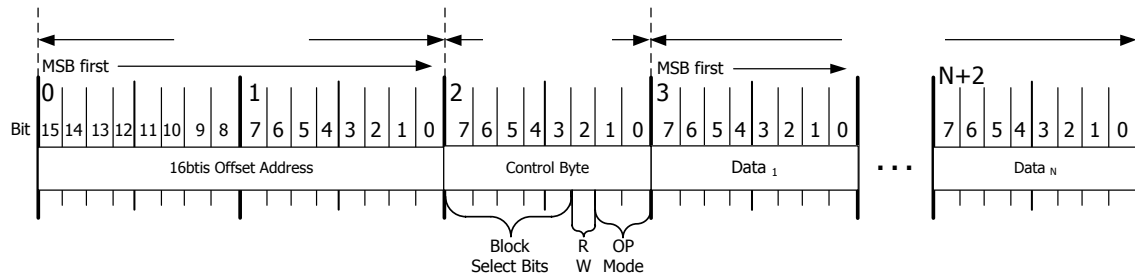

Figure 7. SPI Frame Format

W5500 supports Sequential Data Read/Write. It processes the data from the base (the Offset Address which is set for 2/4/N byte Sequential data processing) and the next data by increasing the Offset Address (auto increment addressing) by 1.

### 2.2.1 Address Phase

This Address Phase specifies the 16 bits Offset Address for the W5500 Registers and TX/RX Buffer Blocks.

The 16-bit Offset Address value is transferred from MSB to LSB sequentially.

The SPI frame with 2/4/N byte data phase supports the Sequential Data Read/Write in which Offset address automatically increases by 1 every 1 byte data.

		11000	Reserved
		11001	Selects Socket 6 Register
		11010	Selects Socket 6 TX Buffer
		11011	Selects Socket 6 RX Buffer
		11100	Reserved
		11101	Selects Socket 7 Register
		11110	Selects Socket 7 TX Buffer
		11111	Selects Socket 7 RX Buffer
		If the Reserved Bits are selected, it can cause the mal-function of the W5500.	
2	RWB	This sets Read/Write Access Mode. '0' : Read '1' : Write	
1~0	OM [1:0]	This sets the SPI Operation Mode. SPI Operation Mode supports two modes, the Variable Length Data Mode and the Fixed Length Data Mode.  : Data Length is controlled by SCSn. External Host makes SCSn Signal Assert (High-to-Low) and informs the start of the SPI Frame Address Phase to W5500. Then the external host transfers the Control Phase with OM[1:0]='00'. After N-Bytes Data Phase transfers, SCSn Signal is De-asserted (Low-to-High) and informs the end of the SPI Frame Data Phase to W5500. In VDM Mode, the SCSn must be controlled with SPI Frame unit by the External Host. (Refer to the Figure 4)  : In FDM, the Data Length is set by OM[1:0], these are not '00' value. So, the SCSn signal should be Low state, and has one Length type (among 1 Bytes, 2 Bytes, 4 Bytes) according to the OM[1:0] value. (Refer to the Figure 5.)  The next table shows the SPI Operation Mode according to the OM[1:0].	

		OM[1:0]	Meaning
		00	Variable Data Length Mode, N-Bytes Data Phase (1 N)
		01	Fixed Data Length Mode , 1 Byte Data Length (N = 1)
		10	Fixed Data Length Mode , 2 Byte Data Length (N = 2)
		11	Fixed Data Length Mode , 4 Byte Data Length (N = 4)

### 2.2.3 Data Phase

With the Control Phase set by the SPI Operation Mode Bits OM[1:0], the Data Phase is set by two types of length, one type is the N-Bytes length (VDM mode) and the other type is 1/2/4 Bytes (FDM mode).

At this time, 1 byte data is transferred through MOSI or MISO signal from MSB to LSB sequentially.

## 2.3 Variable Length Data Mode (VDM)

In VDM mode, the SPI Frame Data Phase Length is determined by SCSn Control of the External Host. That means that the Data Phase Length can have random value (Any length from 1 Byte to N Bytes) according to the SCSn Control.

The OM[1:0] of the Control Phase should be '00' value in VDM mode.

### 2.3.1 Write Access in VDM

Figure 8. Write SPI Frame in VDM mode

Figure 8 shows the SPI Frame when the external host accesses W5500 for writing.

In VDM mode, the RWB signal is '1' (Write), OM[1:0] is '00' in SPI Frame Control Phase. At this time the External Host asserts (High-to-Low) SCSn signal before transmitting SPI Frame. Then the Host transmits SPI Frame's all bits to W5500 through MOSI signal. All bits are synchronized with the falling edge of the SCLK. After finishing the SPI Frame transmit, the Host deasserts SCSn signal (Low-to-High).

When SCSn is Low and the Data Phase continues, the Sequential Data Write can be supported.

When the Host writes Data 0xAA to 'Socket Interrupt Mask Register (SIMR) of Common Register Block by using VDM mode, the data is written with the SPI Frame below.

Offset Address = 0x0018  
 BSB[4:0] = '00000'  
 RWB = '1'  
 OM[1:0] = '00'  
 1<sup>st</sup> Data = 0xAA

The External Host asserts (High-to-Low) SCSn before transmitting SPI Frame, then the Host transmits 1 bit with synchronizing the Toggle SCLK. The External Host de-asserts (Low-to-High) the SCSn at the end of SPI Frame transmit. (Refer to the Figure 9)

Figure 9. SIMR Register Write in VDM Mode

When the Host writes 5 Bytes Data (0x11, 0x22, 0x33, 0x44, 0x55) to Socket 1's TX Buffer Block 0x0040 Address by using VDM mode, 5 bytes data are written with the SPI Frame below.

```

Offset Address = 0x0040
BSB[4:0]      = '00110'
RWB           = '1'
OM[1:0]       = '00'
1st Data      = 0x11
2nd Data      = 0x22
3rd Data      = 0x33
4th Data      = 0x44
5th Data      = 0x55

```

The N-Bytes Write Access is shown in Figure 10.

The 5 bytes of Data (0x11, 0x22, 0x33, 0x44, 0x55) are written sequentially to Socket 1's Tx Buffer Block Address 0x0040 ~ 0x0044.

The External Host asserts (High-to-Low) SCSn before transmitting SPI Frame.

The External Host de-asserts (Low-to-High) the SCSn at the end of SPI Frame transmit.

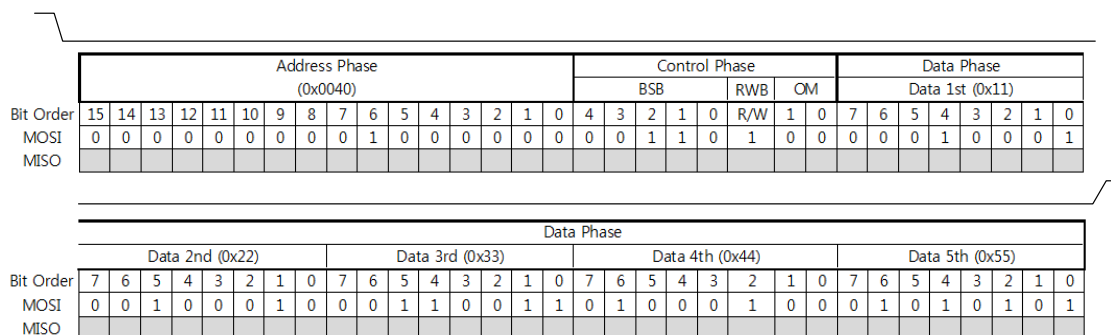

Figure 10. 5 Byte Data Write at 1th Socket's TX Buffer Block 0x0040 in VDM mode

## 2.3.2 Read Access in VDM

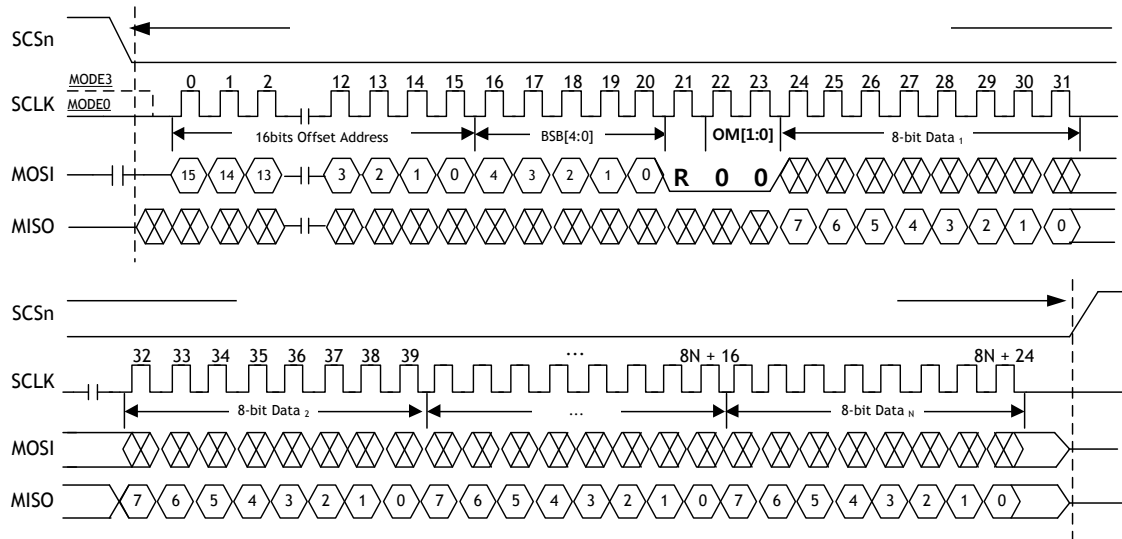

Figure 11. Read SPI Frame in VDM mode

Figure 11 shows the SPI Frame when external host accesses W5500 for reading. In VDM mode, the RWB signal is '0' (Write), OM[1:0] is '00' in SPI Frame Control Phase. At this time the External Host asserts (High-to-Low) SCSn signal before transmitting SPI Frame.

Then the Host transmits Address and Control Phase all bits to W5500 through MOSI signal. All bits are synchronized with the falling edge of the SCLK.

Then the Host receives all bits of Data Phase with synchronizing the rising edge of Sampling SCLK through MISO signal.

After finishing the Data Phase receive, the Host de-asserts SCSn signal (Low-to-High).

When SCSn is Low and the Data Phase continues to receive, the Sequential Data Read can be supported.

When the Host reads the 'Socket Status Register(S7\_SR) of the Socket 7's Register Block by using VDM mode, the data is read with the SPI Frame below. Let's S7\_SR to 'SOCK\_ESTABLISHED (0x17)'.

```
Offset Address = 0x0003
BSB[4:0]       = '11101'
RWB            = '0'
OM[1:0]        = '00'
1st Data       = 0x17
```

The External Host asserts (High-to-Low) SCSn signal before transmitting SPI Frame, then the Host transmits Address and Control Phase to W5500 through the MOSI signal. Then the Host receives Data Phase from the MISO signal. After finishing the Data Phase receives, the Host de-asserts SCSn signal (Low-to-High). (Refer to the Figure 12)

Bit Order	Address Phase (0x0003)																Control Phase						Data Phase									
																	BSB			RWB	OM		Data 1st (0x17)									
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	4	3	2	1	0	R/W	1	0	7	6	5	4	3	2	1	0
MOSI	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1	1	0	1	0	0	0								
MISO																									0	0	0	1	0	1	1	1

Figure 12. S7\_SR Read in VDM Mode

When the Host reads 5 Bytes Data (0xAA, 0xBB, 0xCC, 0xDD, 0xEE) from the Socket 3's RX Buffer Block 0x0100 Address by using VDM mode, 5 bytes data are read with the SPI Frame as below.

```

Offset Address = 0x0100
BSB[4:0]      = '01111'
RWB           = '0'
OM[1:0]       = '00'
1st Data      = 0xAA
2nd Data      = 0xBB
3rd Data      = 0xCC
4th Data      = 0xDD
5th Data      = 0xEE
  
```

The N-Bytes Read Access is shown in Figure 13.

The 5 bytes of Data (0xAA, 0xBB, 0xCC, 0xDD, 0xEE) are read sequentially from the Socket 3's Rx Buffer Block Address 0x0100 ~ 0x0104.

The External Host asserts (High-to-Low) SCSn before transmitting SPI Frame.

The External Host de-asserts (Low-to-High) the SCSn at the end of the SPI Frame Data Phase.

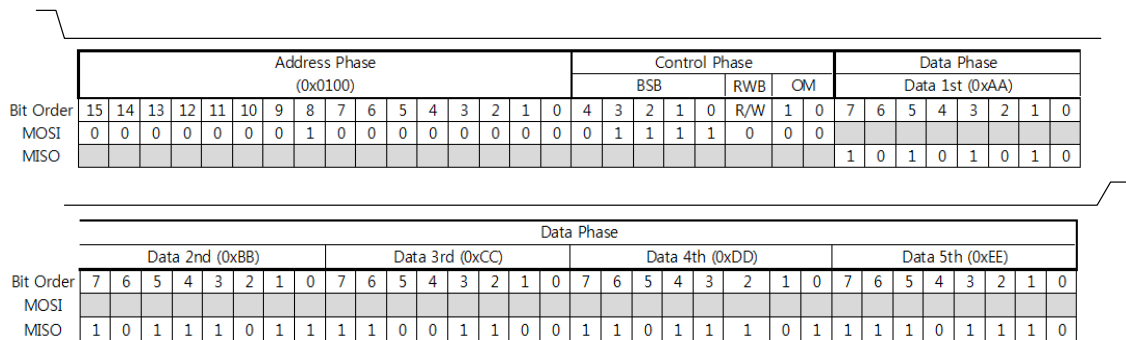

Figure 13. 5 Byte Data Read at Socket 3 RX Buffer Block 0x0100 in VDM mode

---

## 2.4 Fixed Length Data Mode (FDM)

The FDM mode can be used when the External Host cannot control SCSn signal. The SCSn signal should be tied to Low (Always connected to GND) and it is not possible to share the SPI Bus with other SPI Devices. (Refer to the Figure 5)

In VDM mode, Data Phase length is controlled by SCSn control. But in FDM mode, Data Phase length is controlled by OM[1:0] value ('01' / '10' / '11') which is the SPI Operation Mode Bits of the Control Phase.

As the SPI Frame of FDM mode is the same as SPI Frame of VDM mode (1Byte, 2 Bytes, 4 Bytes SPI Frame) except for the SCSn signal control and OM[1:0] setting, the detail about FDM mode is not described in this section.

It is not recommended to use the FDM mode unless you are in inevitable status. In addition, we use only 1/2/4 Bytes SPI Frame, as described in 'Chapter 2.4.1' & 'Chapter 2.4.2'. Using SPI Frame with other length of Data will cause malfunction of W5500.

### 3 Register and Memory Organization

W5500 has one Common Register Block, eight Socket Register Blocks, and TX/RX Buffer Blocks allocated to each Socket. Each block is selected by the BSB[4:0](Block Select Bit) of SPI Frame.

Figure 20 shows the selected block by the BSB[4:0] and the available offset address range of Socket TX/RX Buffer Blocks. Each Socket's TX Buffer Block exists in one 16KB TX memory physically and is initially allocated with 2KB.

Also, Each Socket's RX Buffer Block exists in one 16KB RX Memory physically and is initially allocated with 2KB.

Regardless of the allocated size of each Socket TX/RX Buffer, it can be accessible within the 16 bits offset address range (From 0x0000 to 0xFFFF).

Refer to 'Chapter 3.3' for more information about 16KB TX/RX Memory organization and access method.

### 3.1 Common Register Block

Common Register Block configures the general information of W5500 such as IP and MAC address. This block can be selected by the BSB[4:0] value of SPI Frame. Table 3 defines the offset address of registers in this block. Refer to ‘Chapter 4.1’ for more details about each register.

Table 3. Offset Address for Common Register

Offset	Register	Offset	Register	Offset	Register
0x0000	Mode (MR)	0x0013	Interrupt Low Level Timer (INTLEVEL0)	0x0021	(PHAR3)
0x0001	Gateway Address (GAR0)	0x0014	(INTLEVEL1)	0x0022	(PHAR4)
0x0002	(GAR1)	0x0015	Interrupt (IR)	0x0023	(PHAR5)

0x0010	(SIPR1)				Chip version (VERSIONR)
0x0011	(SIPR2)				
0x0012	(SIPR3)				
0x003A ~ 0xFFFF	Reserved				

## 3.2 Socket Register Block

W5500 supports 8 Sockets for communication channel. Each Socket is controlled by Socket n Register Block(when  $0 \leq n < 7$ ). The n value of Socket n Register can be selected by BSB[4:0] of SPI Frame. Table 4 defines the 16bits Offset Address of registers in Socket n Register Block.

Refer to 'Chapter 4.2' for more details about each register.

Table 4. Offset Address in Socket n Register Block ( $0 \leq n < 7$ )

Offset	Register	Offset	Register	Offset	Register
0x0000	Socket n Mode (Sn_MR)	0x0010	Socket n Destination Port (Sn_DPORT0)	0x0024	Socket n TX Write Pointer
0x0001	Socket n Command (Sn_CR)	0x0011	(Sn_DPORT1)	0x0025	(Sn_TX_WR0) (Sn_TX_WR1)
0x0002	Socket n Interrupt (Sn_IR)	0x0012	Socket n Maximum Segment Size (Sn_MSSR0)	0x0026	Socket n RX Received Size
0x0003	Socket n Status (Sn_SR)	0x0013	(Sn_MSSR1)	0x0027	(Sn_RX_RSR0) (Sn_RX_RSR1)
0x0004	Socket n Source Port (Sn_PORT0)	0x0014	Reserved	0x0028	Socket n RX Read Pointer (Sn_RX_RD0)

0x000F	(Sn_DIPR3)				

---

### 3.3 Memory

W5500 has one 16KB TX memory for Socket n TX Buffer Blocks and one 16KB RX memory for Socket n RX buffer Blocks.

16KB TX memory is initially allocated in 2KB size for each Socket TX Buffer Block ( $2\text{KB} \times 8 = 16\text{KB}$ ). The initial allocated 2KB size of Socket n TX Buffer can be re-allocated by using 'Socket n TX Buffer Size Register (Sn\_TXBUF\_SIZE)'.

Once all Sn\_TXBUF\_SIZE registers have been configured, Socket TX Buffer is allocated with the configured size of 16KB TX Memory and is assigned sequentially from Socket 0 to Socket 7. Its physical memory address is automatically determined in 16KB TX memory. Therefore, the total sum of Sn\_TXBUF\_SIZE should be not exceed 16 in case of error in data transmission.

The 16KB RX memory allocation method is the same as the 16KB TX memory allocation method. 16KB RX memory is initially allocated into 2KB size for each Socket RX Buffer Block ( $2\text{KB} \times 8 = 16\text{KB}$ ). The initial allocated 2KB size of Socket n RX Buffer can be re-allocated by using 'Socket n RX Buffer Size Register (Sn\_RXBUF\_SIZE)'.

When all Sn\_RXBUF\_SIZE registers have been configured, the Socket RX Buffer is allocated with the configured size in 16KB RX Memory and is assigned sequentially from Socket 0 to Socket 7. The physical memory address of the Socket RX Buffer is automatically determined in 16KB RX memory. Therefore, the total sum of Sn\_RXBUF\_SIZE should not exceed 16, data reception error will occur if exceeded.

For 16KB TX/RX memory allocation, refer to Sn\_TXBUF\_SIZE & Sn\_RXBUF\_SIZE in 'Chapter 4.2'.

The Socket n TX Buffer Block allocated in 16KB TX memory is buffer for saving data to be transmitted by host. The 16bits Offset Address of Socket n TX Buffer Block has 64KB address space ranged from 0x0000 to 0xFFFF, and it is configured with reference to 'Socket n TX Write Pointer Register (Sn\_TX\_WR)' & 'Socket n TX Read Pointer Register(Sn\_RX\_RD)'. However, the 16bits Offset Address automatically converts into the physical address to be accessible in 16KB TX memory such as Figure 20. Refer to 'Chapter 4.2' for Sn\_TX\_WR & Sn\_TX\_RD.

The Socket n RX Buffer Block allocated in 16KB RX memory is buffer for saving the received data through the Ethernet. The 16bits Offset Address of Socket n RX Buffer Block has 64KB address space ranged from 0x0000 to 0xFFFF, and it is configured with reference to 'Socket n RX RD Pointer Register (Sn\_RX\_RD)' & 'Socket n RX Write Pointer Register (Sn\_RX\_WR)'. However, the 16bits Offset Address automatically converts into the physical address to be accessible in 16KB RX memory such as Figure 20. Refer to 'Chapter 4.2' for Sn\_RX\_RD & Sn\_RX\_WR.

## 4 Register Descriptions

### 4.1 Common Registers

MR is used for S/W reset, ping block mode and PPPoE mode.

7	6	5	4	3	2	1	0
RST	Reserved	WOL	PB	PPPoE	Reserved	FARP	Reserved

7	RST	If this bit is '1', All internal registers will be initialized. It will be automatically cleared as '0' after S/W reset.
6	Reserved	Reserved
5	WOL	<p>0 : Disable WOL mode 1 : Enable WOL mode</p> <p>If WOL mode is enabled and the received magic packet over UDP has been normally processed, the Interrupt PIN (INTn) asserts to low. When using WOL mode, the UDP Socket should be opened with any source port number. (Refer to Socket n Mode Register (Sn_MR) for opening Socket.)</p> <p>Notice: The magic packet over UDP supported by W5500 consists of 6 bytes synchronization stream ('0xFFFFFFFF') and 16 times Target MAC address stream in UDP payload. The options such like password are ignored. You can use any UDP source port number for WOL mode.</p>
4	PB	<p>0 : Disable Ping block 1 : Enable Ping block</p> <p>If the bit is '1', it blocks the response to a ping request.</p>
3	PPPoE	<p>0 : Disable PPPoE mode 1 : Enable PPPoE mode</p> <p>If you use ADSL, this bit should be '1'.</p>
2	Reserved	Reserved
1	FARP	

<sup>2</sup> Register Notation : [Read/Write/ReadClearWrite1] [Address] [Reset value];  
ReadClearWrite1 (RCW1) Software can read as well as clear this bit by writing 1. Writing '0' has no effect on the bit value.

		0 : Disable Force ARP mode 1 : Enable Force ARP mode In Force ARP mode, It forces on sending ARP Request whenever data is sent.
0	Reserved	Reserved

GAR configures the default gateway address.

In case of "192.168.0.1"

0x0001	0x0002	0x0003	0x0004
192 (0xC0)	168 (0xA8)	0 (0x00)	1 (0x01)

SUBR configures the subnet mask address.

In case of "255.255.255.0"

0x0005	0x0006	0x0007	0x0008
255 (0xFF)	255 (0xFF)	255 (0xFF)	0 (0x00)

SHAR configures the source hardware address.

In case of "00.08.DC.01.02.03"

0x0009	0x000A	0x000B	0x000C	0x000D	0x000E
0x00	0x08	0xDC	0x01	0x02	0x03

SIPR configures the source IP address.

In case of "192.168.0.2"

0x000F	0x0010	0x0011	0x0012
192 (0xC0)	168 (0xA8)	0 (0x00)	2 (0x02)

INTLEVEL configures the Interrupt Assert Wait Time ( $I_{AWT}$ ). When the next interrupt occurs, Interrupt PIN ( $INTn$ ) will assert to low after INTLEVEL time.

$$I_{AWT} = (INTLEVEL + 1) \times \frac{1}{PLL_{clk}^3} \times 4 \quad (\text{when } INTLEVEL > 0)$$

Equation 1 Interrupt Assert Wait Time

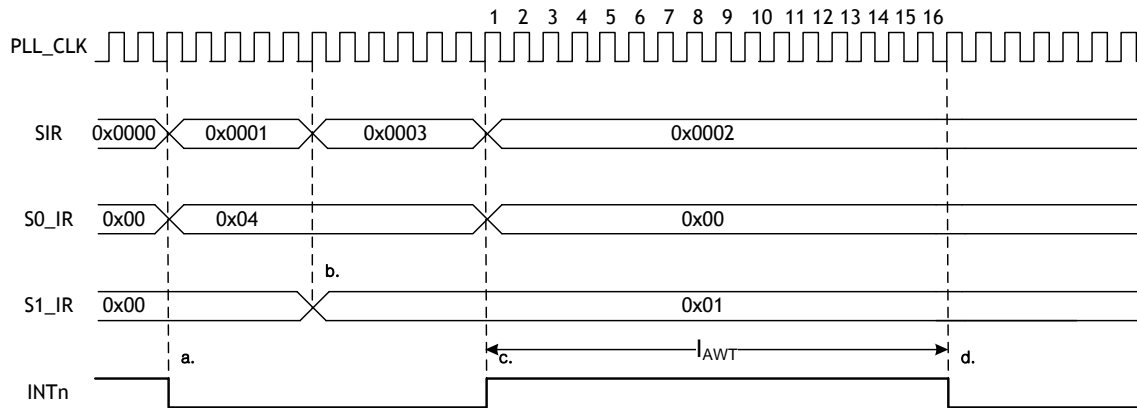

Figure 21. INTLEVEL Timing

a. When Timeout Interrupt of Socket 0 is occurred,  $SO\_IR[3]$  &  $SIR[0]$  bit set as '1' and then  $INTn$  PIN is asserted to low.

b. When the connection interrupt of Socket 1 is occurred before the previous interrupt processing is not completed,  $S1\_IR[0]$  &  $SIR[1]$  bits set as '1' and  $INTn$  PIN is still low.

c. If the host processed the previous interrupt completely by clearing the  $SO\_IR[3]$  bit,  $INTn$  PIN is de-asserted to high but  $S1\_IR[0]$  &  $SIR[1]$  is still set as '1'.

d. Although  $S1\_IR[0]$  &  $SIR[1]$  bit is set as '1', the  $INTn$  can't be asserted to low during INTLEVEL time. After the INTLEVEL time expires, the  $INTn$  will be asserted to low.

<sup>3</sup>  $PLL_{clk}$  is 150MHz

IR indicates the interrupt status. Each bit of IR can be cleared when the host writes '1' value to each bit. If IR is not equal to '0x00', INTn PIN is asserted low until it is '0x00'.

7	6	5	4	3	2	1	0
CONFLICT	UNREACH	PPPoE	MP	Reserved	Reserved	Reserved	Reserved

7	CONFLICT	Bit is set as '1' when own source IP address is same with the sender IP address in the received ARP request.
6	UNREACH	When receiving the ICMP (Destination port unreachable) packet, this bit is set as '1'. When this bit is '1', Destination Information such as IP address and Port number may be checked with the corresponding UIPR & UPORTR.
5	PPPoE	When PPPoE is disconnected during PPPoE mode, this bit is set.
4	MP	When WOL mode is enabled and receives the magic packet over UDP, this bit is set.
3-0	Reserved	Reserved

IMR is used to mask interrupts. Each bit of IMR corresponds to each bit of IR. When a bit of IMR is '1' and the corresponding bit of IR is '1', an interrupt will be issued. In other words, if a bit of IMR is '0', an interrupt will not be issued even if the corresponding bit of IR is '1'.

7	6	5	4	3	2	1	0
IM_IR7	IM_IR6	IM_IR5	IM_IR4	Reserved	Reserved	Reserved	Reserved

7	IM_IR7	
6	IM_IR6	
5	IM_IR5	
4	IM_IR4	
3~0	Reserved	Reserved

SIR indicates the interrupt status of Socket. Each bit of SIR be still '1' until Sn\_IR is cleared by the host. If Sn\_IR is not equal to '0x00', the n-th bit of SIR is '1' and INTn PIN is asserted until SIR is '0x00'.

7	6	5	4	3	2	1	0
S7_INT	S6_INT	S5_INT	S4_INT	S3_INT	S2_INT	S1_INT	S0_INT

7 ~ 0	Sn_INT	When the interrupt of Socket n occurs, the n-th bit of SIR becomes '1'.

Each bit of SIMR corresponds to each bit of SIR. When a bit of SIMR is '1' and the corresponding bit of SIR is '1', Interrupt will be issued. In other words, if a bit of SIMR is '0', an interrupt will be not issued even if the corresponding bit of SIR is '1'.

7	6	5	4	3	2	1	0
S7_IMR	S6_IMR	S5_IMR	S4_IMR	S3_IMR	S2_IMR	S1_IMR	S0_IMR

7 ~ 0	Sn_IMR	<i>n</i>  <i>n</i>

RTR configures the retransmission timeout period. The unit of timeout period is 100us and the default of RTR is '0x07D0' or '2000'. And so the default timeout period is 200ms(100us X 2000).

During the time configured by RTR, W5500 waits for the peer response to the packet that is transmitted by Sn\_CR(CONNECT, DISCON, CLOSE, SEND, SEND\_MAC, SEND\_KEEP command). If the peer does not respond within the RTR time, W5500 retransmits the packet or issues timeout.

When timeout-period is set as 400ms,  $RTR = (400ms / 1ms) \times 10 = 4000(0x0FA0)$

0x0019	0x001A
0x0F	0xA0

RCR configures the number of time of retransmission. When retransmission occurs as many as 'RCR+1', Timeout interrupt is issued (Sn\_IR[TIMEOUT] = '1').

RCR = 0x0007

0x001B
0x07

The timeout of W5500 can be configurable with RTR and RCR. W5500 has two kind timeout such as Address Resolution Protocol (ARP) and TCP retransmission.

At the ARP (Refer to RFC 826, <http://www.ietf.org/rfc.html>) retransmission timeout, W5500 automatically sends ARP-request to the peer's IP address in order to acquire MAC address information (used for communication of IP, UDP, or TCP). While waiting for ARP-response from the peer, if there is no response during the configured RTR time, a temporary timeout is occurred and ARP-request is retransmitted. It is repeated as many as 'RCR + 1' times. Even after the ARP-request retransmissions are repeated as 'RCR+1' and there is no response to the ARP-request, the final timeout is occurred and Sn\_IR(TIMEOUT) becomes '1'. The time of final timeout (ARP<sub>TO</sub>) of ARP-request is as below.

$$ARP_{TO} = (RTR \times 0.1ms) \times (RCR + 1)$$

At the TCP packet retransmission timeout, W5500 transmits TCP packets (SYN, FIN, RST, DATA packets) and waits for the acknowledgement (ACK) during the configured RTR time and RCR. If there is no ACK from the peer, a temporary timeout occurs and

PHAR should be written to the PPPoE server hardware address acquired in PPPoE connection process

In case that destination hardware address is 00:08:DC:12:34:56

0x001E	0x001F	0x0020	0x0021	0x0022	0x0023
0x00	0x08	0xDC	0x12	0x34	0x56

PSID should be written to the PPPoE sever session ID acquired in PPPoE connection process.

In case that Session ID is 0x1234

0x0024	0025
18 (0x12)	52(0x34)

PMRU configures the maximum receive unit of PPPoE.

in case that maximum receive unit in PPPoE is 0x1234

0x0026	0027
18 (0x12)	52 (0x34)

W5500 receives an ICMP packet(Destination port unreachable) when data is sent to a port number which socket is not open and UNREACH bit of IR becomes '1' and UIPR & UPORTR indicates the destination IP address & port number respectively.

In case of "192.168.0.11"

0x0028	0x0029	0x002A	0x002B
192 (0xC0)	168 (0xA8)	0 (0x00)	11 (0x0E)

In case of "0x1234"

0x002C	002D
18 (0x12)	52(0x34)

PHYCFGR configures PHY operation mode and resets PHY. In addition, PHYCFGR indicates the status of PHY such as duplex, Speed, Link.

7	RST	When this bit is '0', internal PHY is reset. After PHY reset, it should be set as '1'.																																				
6	OPMD	<p><b>Configure PHY Operation Mode</b></p> <p>1: Configure with OPMD[2:0] in PHYCFGR</p> <p>0: Configure with the H/W PINs(PMODE[2:0])</p> <p>This bit configures PHY operation mode with OPMD[2:0] bits or PMODE[2:0] PINs. When W5500 is reset by POR or RSTn PIN, PHY operation mode is configured with PMODE[2:0] PINs by default. After POR or RSTn reset, user can re-configure PHY operation mode with OPMD[2:0]. If user wants to re-configure with OPMD[2:0], it should reset PHY by setting the RST bit to '0' after the user configures this bit as '1' and OPMD[2:0] .</p>																																				
5-3	OPMDC	<p>These bits select the operation mode of PHY such as following table.</p> <table> <tr> <th>5</th> <th>4</th> <th>3</th> <th>Description</th> </tr> <tr> <td>0</td> <td>0</td> <td>0</td> <td>10BT Half-duplex, Auto-negotiation disabled</td> </tr> <tr> <td>0</td> <td>0</td> <td>1</td> <td>10BT Full-duplex, Auto-negotiation disabled</td> </tr> <tr> <td>0</td> <td>1</td> <td>0</td> <td>100BT Half-duplex, Auto-negotiation disabled</td> </tr> <tr> <td>0</td> <td>1</td> <td>1</td> <td>100BT Full-duplex, Auto-negotiation disabled</td> </tr> <tr> <td>1</td> <td>0</td> <td>0</td> <td>100BT Half-duplex, Auto-negotiation enabled</td> </tr> <tr> <td>1</td> <td>0</td> <td>1</td> <td>Not used</td> </tr> <tr> <td>1</td> <td>1</td> <td>0</td> <td>Power Down mode</td> </tr> <tr> <td>1</td> <td>1</td> <td>1</td> <td>All capable, Auto-negotiation enabled</td> </tr> </table>	5	4	3	Description	0	0	0	10BT Half-duplex, Auto-negotiation disabled	0	0	1	10BT Full-duplex, Auto-negotiation disabled	0	1	0	100BT Half-duplex, Auto-negotiation disabled	0	1	1	100BT Full-duplex, Auto-negotiation disabled	1	0	0	100BT Half-duplex, Auto-negotiation enabled	1	0	1	Not used	1	1	0	Power Down mode	1	1	1	All capable, Auto-negotiation enabled

VERSIONR always indicates the W5500 version as 0x04.

## 4.2 Socket Registers

$n^4$

Sn\_MR configures the option or protocol type of Socket n.

7	6	5	4	3	2	1	0
MULTI/ MFEN	BCASTB	ND / MC /MMB	UCASTB MIP6B	P3	P2	P1	P0

7	MULTI/ MFEN	<p>0 : disable Multicasting 1 : enable Multicasting This bit is applied only during UDP mode(P[3:0] = '0010'). To use multicasting, Sn_DIPR &amp; Sn_DPORT should be respectively configured with the multicast group IP address &amp; port number before Socket n is opened by OPEN command of Sn_CR</p> <p>0 : disable MAC Filtering 1 : enable MAC Filtering This bit is applied only during MACRAW mode(P[3:0] = '0100'). When set as '1', W5500 can only receive broadcasting packet or packet sent to itself. When this bit is '0', W5500 can receive all packets on Ethernet. If user wants to implement Hybrid TCP/IP stack, it is recommended that this bit is set as '1' for reducing host overhead to process the all received packets.</p>
6	BCASTB	<p>0 : disable Broadcast Blocking 1 : enable Broadcast Blocking This bit blocks to receive broadcasting packet during UDP mode(P[3:0] = '0010'). In addition, This bit does when MACRAW mode(P[3:0] = '0100')</p>
5	ND/MC/ MMB	<p>0 : Disable No Delayed ACK option 1 : Enable No Delayed ACK option This bit is applied only during TCP mode (P[3:0] = '0001').</p>

<sup>4</sup> is Socket number (0, 1, 2, 3, 4, 5, 6, 7). is set 'SNUM[2:0]' in Control Bits sets.

		<p>When this bit is '1', It sends the ACK packet without delay as soon as a Data packet is received from a peer. When this bit is '0', It sends the ACK packet after waiting for the timeout time configured by RTR.</p> <p>0 : using IGMP version 2 1 : using IGMP version 1</p> <p>This bit is applied only during UDP mode(P[3:0] = '0010') and MULTI = '1'. It configures the version for IGMP messages (Join/Leave/Report).</p> <p>0 : disable Multicast Blocking 1 : enable Multicast Blocking</p> <p>This bit is applied only when MACRAW mode(P[3:0] = '0100'). It blocks to receive the packet with multicast MAC address.</p>

*n*

This is used to set the command for Socket *n* such as OPEN, CLOSE, CONNECT, LISTEN, SEND, and RECEIVE. After W5500 accepts the command, the Sn\_CR register is automatically cleared to 0x00. Even though Sn\_CR is cleared to 0x00, the command is still being processed. To check whether the command is completed or not, please check the Sn\_IR or Sn\_SR.

0x01	OPEN	<p>Socket n is initialized and opened according to the protocol selected in Sn_MR (P3:P0). The table below shows the value of Sn_SR corresponding to Sn_MR.</p> <table><tr><th>Sn_MR (P[3:0])</th><th>Sn_SR</th></tr><tr><td>Sn_MR_CLOSE ('0000')</td><td>-</td></tr><tr><td>Sn_MR_TCP ('0001')</td><td>SOCK_INIT (0x13)</td></tr><tr><td>Sn_MR_UDP ('0010')</td><td>SOCK_UDP (0x22)</td></tr><tr><td>SO_MR_MACRAW ('0100')</td><td>SOCK_MACRAW (0x42)</td></tr></table>	Sn_MR (P[3:0])	Sn_SR	Sn_MR_CLOSE ('0000')	-	Sn_MR_TCP ('0001')	SOCK_INIT (0x13)	Sn_MR_UDP ('0010')	SOCK_UDP (0x22)	SO_MR_MACRAW ('0100')	SOCK_MACRAW (0x42)
Sn_MR (P[3:0])	Sn_SR											
Sn_MR_CLOSE ('0000')	-											
Sn_MR_TCP ('0001')	SOCK_INIT (0x13)											
Sn_MR_UDP ('0010')	SOCK_UDP (0x22)											
SO_MR_MACRAW ('0100')	SOCK_MACRAW (0x42)											
0x02	LISTEN	<p>This is valid only in TCP mode (Sn_MR(P3:P0) = Sn_MR_TCP). In this mode, Socket n operates as a 'TCP server' and waits for connection-request (SYN packet) from any 'TCP client'.</p> <p>The Sn_SR changes the state from SOCK_INIT to SOCKET_LISTEN.</p> <p>When a 'TCP client' connection request is successfully established, the Sn_SR changes from SOCK_LISTEN to SOCK_ESTABLISHED and the Sn_IR(0) becomes '1'. But when a 'TCP client' connection request is failed, Sn_IR(3) becomes '1' and the status of Sn_SR changes to SOCK_CLOSED.</p>										
0x04	CONNECT	<p>This is valid only in TCP mode and operates when Socket n acts as 'TCP client'. To connect, a connect-request (SYN packet) is sent to 'TCP server' configured by Sn_DIPR &amp; Sn_DPORT(destination address &amp; port). If the connect-request is successful, the Sn_SR is changed to SOCK_ESTABLISHED and the Sn_IR(0) becomes '1'.</p> <p>The connect-request fails in the following three cases.</p> <ol style="list-style-type: none"><li>1. When a ARP<sub>TO</sub> occurs (Sn_IR(3)='1') because the destination hardware address is not acquired through the ARP-process.</li><li>2. When a SYN/ACK packet is not received and TCP<sub>TO</sub> (Sn_IR(3) = '1')</li><li>3. When a RST packet is received instead of a SYN/ACK packet.</li></ol>										

		In these cases, Sn_SR is changed to SOCK_CLOSED.
0x08	DISCON	<p>Valid only in TCP mode.</p> <p>Regardless of 'TCP server' or 'TCP client', the DISCON command processes the disconnect-process ('Active close' or 'Passive close').</p> <p style="padding-left: 40px;">: it transmits disconnect-request(FIN packet) to the connected peer</p> <p style="padding-left: 40px;">: When FIN packet is received from peer, a FIN packet is replied back to the peer.</p> <p>When the disconnect-process is successful (that is, FIN/ACK packet is received successfully), Sn_SR is changed to SOCK_CLOSED. Otherwise, TCP<sub>TO</sub> occurs (Sn_IR(3)='1')= and then Sn_SR is changed to SOCK_CLOSED.</p> <p>cf&gt; If CLOSE is used instead of DISCON, only Sn_SR is changed to SOCK_CLOSED without disconnect-process.</p> <p>If a RST packet is received from a peer during communication, Sn_SR is unconditionally changed to SOCK_CLOSED.</p>
0x10	CLOSE	<p>Close Socket n.</p> <p>Sn_SR is changed to SOCK_CLOSED.</p>
0x20	SEND	SEND transmits all the data in the Socket n TX buffer. For more details, please refer to Socket n TX Free Size Register (Sn_TX_FSR), Socket n, TX Write Pointer Register(Sn_TX_WR), and Socket n TX Read Pointer Register(Sn_TX_RD).
0x21	SEND_MAC	<p>Valid only in UDP mode.</p> <p>The basic operation is same as SEND. Normally SEND transmits data after destination hardware address is acquired by the automatic ARP-process(Address Resolution Protocol). But SEND_MAC transmits data without the automatic ARP-process. In this case, the destination hardware address is acquired from Sn_DHAR configured by host, instead of APR-process.</p>
0x22	SEND_KEEP	<p>Valid only in TCP mode.</p> <p>It checks the connection status by sending 1byte keep-alive packet.</p> <p>If the peer cannot respond to the keep-alive packet during timeout time, the connection is terminated and the timeout interrupt will occur.</p>

0x40	RECV	<p>RECV completes the processing of the received data in Socket n RX Buffer by using a RX read pointer register (Sn_RX_RD).</p> <p>For more details, refer to Socket n RX Received Size Register (Sn_RX_RSR), Socket n RX Write Pointer Register (Sn_RX_WR), and Socket n RX Read Pointer Register (Sn_RX_RD).</p>
------	------	--

## **n RCW1**

Sn\_IR indicates the status of Socket Interrupt such as establishment, termination, receiving data, timeout). When an interrupt occurs and the corresponding bit of Sn\_IMR is '1', the corresponding bit of Sn\_IR becomes '1'.

In order to clear the Sn\_IR bit, the host should write the bit to '1'.

7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	SEND_OK	TIMEOUT	RECV	DISCON	CON

7~5	Reserved	Reserved
4	SEND_OK	This is issued when SEND command is completed.
3	TIMEOUT	This is issued when ARP <sub>T0</sub> or TCP <sub>T0</sub> occurs.
2	RECV	This is issued whenever data is received from a peer.
1	DISCON	This is issued when FIN or FIN/ACK packet is received from a peer.
0	CON	This is issued one time when the connection with peer is successful and then Sn_SR is changed to SOCK_ESTABLISHED.

*n*

Sn\_SR indicates the status of Socket *n*. The status of Socket *n* is changed by Sn\_CR or some special control packet as SYN, FIN packet in TCP.

0x00	SOCK_CLOSED	<p>This indicates that Socket <i>n</i> is released.</p> <p>When DISCON, CLOSE command is ordered, or when a timeout occurs, it is changed to SOCK_CLOSED regardless of previous status.</p>
0x13	SOCK_INIT	<p>This indicates Socket <i>n</i> is opened with TCP mode.</p> <p>It is changed to SOCK_INIT when Sn_MR (P[3:0]) = '0001' and OPEN command is ordered.</p> <p>After SOCK_INIT, user can use LISTEN /CONNECT command.</p>
0x14	SOCK_LISTEN	<p>This indicates Socket <i>n</i> is operating as 'TCP server' mode and waiting for connection-request (SYN packet) from a peer ('TCP client').</p> <p>It will change to SOCK_ESTABLISHED when the connection-request is successfully accepted.</p> <p>Otherwise it will change to SOCK_CLOSED after TCPTO occurred (Sn_IR(TIMEOUT) = '1').</p>
0x17	SOCK_ESTABLISHED	<p>This indicates the status of the connection of Socket <i>n</i>.</p> <p>It changes to SOCK_ESTABLISHED when the 'TCP SERVER' processed the SYN packet from the 'TCP CLIENT' during SOCK_LISTEN, or when the CONNECT command is successful.</p> <p>During SOCK_ESTABLISHED, DATA packet can be transferred using SEND or RECV command.</p>
0x1C	SOCK_CLOSE_WAIT	<p>This indicates Socket <i>n</i> received the disconnect-request (FIN packet) from the connected peer. This is half-closing status, and data can be transferred. For full-closing, DISCON command is used. But For just-closing, CLOSE command is used.</p>
0x22	SOCK_UDP	<p>This indicates Socket <i>n</i> is opened in UDP mode(Sn_MR(P[3:0]) = '0010').</p> <p>It changes to SOCK_UDP when Sn_MR(P[3:0]) = '0010' and OPEN command is ordered.</p> <p>Unlike TCP mode, data can be transferred without the connection-process.</p>

0x42	SOCK_MACRAW	<p>This indicates Socket 0 is opened in MACRAW mode (SO_MR(P[3:0]) = '0100') and is valid only in Socket 0.</p> <p>It changes to SOCK_MACRAW when SO_MR(P[3:0]) = '0100' and OPEN command is ordered.</p> <p>Like UDP mode socket, MACRAW mode Socket 0 can transfer a MAC packet (Ethernet frame) without the connection-process.</p>
------	-------------	--

0x15	SOCK_SYSENT	<p>This indicates Socket n sent the connect-request packet (SYN packet) to a peer.</p> <p>It is temporarily shown when Sn_SR is changed from SOCK_INIT to SOCK_ESTABLISHED by CONNECT command.</p> <p>If connect-accept(SYN/ACK packet) is received from the peer at SOCK_SYSENT, it changes to SOCK_ESTABLISHED.</p> <p>Otherwise, it changes to SOCK_CLOSED after TCPTO (Sn_IR[TIMEOUT] = '1') is occurred.</p>
0x16	SOCK_SYNRCV	<p>It indicates Socket n successfully received the connect-request packet (SYN packet) from a peer.</p> <p>If socket n sends the response (SYN/ACK packet) to the peer successfully, it changes to SOCK_ESTABLISHED. If not, it changes to SOCK_CLOSED after timeout occurs (Sn_IR[TIMEOUT] = '1').</p>
0x18	SOCK_FIN_WAIT	<p>These indicate Socket n is closing.</p> <p>These are shown in disconnect-process such as active-close and passive-close.</p> <p>When Disconnect-process is successfully completed, or when timeout occurs, these change to SOCK_CLOSED.</p>
0x1A	SOCK_CLOSING	
0x1B	SOCK_TIME_WAIT	
0x1D	SOCK_LAST_ACK	

*n*

Sn\_PORT configures the source port number of Socket *n*. It is valid when Socket *n* is used in TCP/UDP mode. It should be set before OPEN command is ordered.

In case of Socket 0 Port = 5000(0x1388), configure as below,

0x0004	0x0005
0x13	0x88

*n*

Sn\_DHAR configures the destination hardware address of Socket *n* when using SEND\_MAC command in UDP mode or it indicates that it is acquired in ARP-process by CONNECT/SEND command.

In case of Socket 0 Destination Hardware address = 08.DC.00.01.02.10, configure as below.

0x0006	0x0007	0x0008	0x0009	0x000A	0x000B
0x08	0xDC	0x00	0x01	0x02	0x0A

*n*

Sn\_DIPR configures or indicates the destination IP address of Socket *n*. It is valid when Socket *n* is used in TCP/UDP mode.

In TCP client mode, it configures an IP address of 'TCP server' before CONNECT command.

In TCP server mode, it indicates an IP address of 'TCP client' after successfully establishing connection.

In UDP mode, it configures an IP address of peer to be received the UDP packet by SEND or SEND\_MAC command.

In case of Socket 0 Destination IP address = 192.168.0.11, configure as below.

0x000C	0x000D	0x000E	0x000F
192 (0xC0)	168 (0xA8)	0 (0x00)	11 (0x0B)

*n*

Sn\_DPORT configures or indicates the destination port number of Socket *n*. It is valid when Socket *n* is used in TCP/UDP mode.

In TCP client mode, it configures the listen port number of 'TCP server' before CONNECT command.

In TCP server mode, it indicates the port number of 'TCP client' after successfully establishing connection.

In UDP mode, it configures the port number of peer to be transmitted the UDP packet by SEND/SEND\_MAC command.

In case of Socket 0 Destination Port = 5000(0x1388), configure as below,

0x0010	0x0011
0x13	0x88

*n*

This register is used for MSS (Maximum Segment Size) of TCP, and the register displays MSS set by the other party when TCP is activated in Passive Mode.

In case of Socket 0 MSS = 1460 (0x05B4), configure as below,

0x0012	0x0013
0x05	0xB4

*n*

Sn\_TOS configures the TOS(Type Of Service field in IP Header) of Socket *n*.

It is set before OPEN command.

For more the details, refer to <http://www.iana.org/assignments/ip-parameters>.

*n*

Sn\_TTL configures the TTL(Time To Live field in IP header) of Socket *n*.

It is set before OPEN command.

For more the details, refer to <http://www.iana.org/assignments/ip-parameters>.

*n*

Sn\_RXBUF\_SIZE configures the RX buffer block size of Socket *n*. Socket *n* RX Buffer Block size can be configured with 1,2,4,8, and 16 Kbytes. If a different size is configured, the data cannot be normally received from a peer.

Although Socket *n* RX Buffer Block size is initially configured to 2Kbytes, user can re-configure its size using Sn\_RXBUF\_SIZE. The total sum of Sn\_RXBUF\_SIZE cannot be exceed 16Kbytes. When exceeded, the data reception error is occurred.

When all Sn\_RXBUF\_SIZE have been configured, Socket *n* RX Buffer is allocated with the configured size in 16KB RX Memory and is assigned sequentially from Socket 0 to Socket 7.

Socket n RX Buffer Block can be accessible with the 16bits Offset Address ranged from 0x0000 to 0xFFFF regardless of the configured size. (Refer to Sn\_RX\_RD & Sn\_RX\_WR).

Value (dec)	0	1	2	4	8	16
Buffer size	0KB	1KB	2KB	4KB	8KB	16KB

Socket 0 RX Buffer Size = 8KB

*n*

Sn\_TXBUF\_SIZE configures the TX buffer block size of Socket n. Socket n TX Buffer Block size can be configured with 1,2,4,8, and 16 Kbytes. If a different size is configured, the data can't be normally transmitted to a peer.

Although Socket n TX Buffer Block size is initially configured to 2Kbytes, user can be re-configure its size using Sn\_TXBUF\_SIZE. The total sum of Sn\_TXBUF\_SIZE cannot be exceed 16Kbytes. When exceeded, the data transmission error is occurred.

When all Sn\_TXBUF\_SIZE have been configured, Socket n TX Buffer is allocated with the configured size in 16KB TX Memory and is assigned sequentially from Socket 0 to Socket 7.

Socket n TX Buffer Block can be accessible with 16bits Offset Address ranged from 0x0000 to 0xFFFF regardless of the configured size. (Refer to Sn\_TX\_WR & Sn\_TX\_RD).

Value (dec)	0	1	2	4	8	16
Buffer size	0KB	1KB	2KB	4KB	8KB	16KB

Socket 0 TX Buffer Size = 4KB

*n*

Sn\_TX\_FSR indicates the free size of Socket n TX Buffer Block. It is initialized to the configured size by Sn\_TXBUF\_SIZE. Data bigger than Sn\_TX\_FSR should not be saved in the Socket n TX Buffer because the bigger data overwrites the previous saved data not yet sent. Therefore, check before saving the data to the Socket n TX Buffer, and if data is equal or smaller than its checked size, transmit the data with

SEND/SEND\_MAC command after saving the data in Socket n TX buffer. But, if data is bigger than its checked size, transmit the data after dividing into the checked size and saving in the Socket n TX buffer.

If Sn\_MR(P[3:0]) is not TCP mode('0001'), it is automatically calculated as the difference between 'Socket n TX Write Pointer (Sn\_TX\_WR)' and 'Socket n TX Read Pointer (Sn\_TX\_RD)'.

If Sn\_MR(P[3:0]) is TCP mode('0001'), it is automatically calculated as the difference between Sn\_TX\_WR and the internal ACK pointer which indicates the point of data is received already by the connected peer.

In case of 2048(0x0800) in SO\_TX\_FSR,

0x0020	0x0021
0x08	0x00

Because this register for representing the size information is 16 bits, it is impossible to read all bytes at the same time. Before 16 bit-read operation is not completed, the value may be changed.

Therefore, it is recommended that you read all 16-bits twice or more until getting the same value.

Sn\_TX\_RD is initialized by OPEN command. However, if Sn\_MR(P[3:0]) is TCP mode('0001'), it is re-initialized while connecting with TCP.

After its initialization, it is auto-increased by SEND command. SEND command transmits the saved data from the current Sn\_TX\_RD to the Sn\_TX\_WR in the Socket n TX Buffer. After transmitting the saved data, the SEND command increases the Sn\_TX\_RD as same as the Sn\_TX\_WR.

If its increment value exceeds the maximum value 0xFFFF, (greater than 0x10000 and the carry bit occurs), then the carry bit is ignored and will automatically update with the lower 16bits value.

*n*

Sn\_TX\_WR is initialized by OPEN command. However, if Sn\_MR(P[3:0]) is TCP mode('0001'), it is re-initialized while connecting with TCP.

It should be read or to be updated like as follows.

1. Read the starting address for saving the transmitting data.
2. Save the transmitting data from the starting address of Socket n TX buffer.

3. After saving the transmitting data, update Sn\_TX\_WR to the increased value as many as transmitting data size. If the increment value exceeds the maximum value 0xFFFF (greater than 0x10000 and the carry bit occurs), then the carry bit is ignored and will automatically update with the lower 16bits value.
4. Transmit the saved data in Socket n TX Buffer by using SEND/SEND command

Sn\_RX\_RSR indicates the data size received and saved in Socket n RX Buffer. Sn\_RX\_RSR does not exceed the Sn\_RXBUF\_SIZE and is calculated as the difference between 'Socket n RX Write Pointer (Sn\_RX\_WR)' and 'Socket n RX Read Pointer (Sn\_RX\_RD)'.

In case of 2048(0x0800) in S0\_RX\_RSR,

0x0026	0x0027
0x08	0x00

Because this register for representing the size information is 16 bits, it is impossible to read all bytes at the same time. Before 16 bit-read operation is not completed, the value may be changed.

Therefore, it is recommended that you read all 16-bits twice or more until getting the same value.

**n**

Sn\_RX\_RD is initialized by OPEN command. Make sure to be read or updated as follows.

1. Read the starting save address of the received data
2. Read data from the starting address of Socket n RX Buffer.
3. After reading the received data, Update Sn\_RX\_RD to the increased value as many as the reading size. If the increment value exceeds the maximum value 0xFFFF, that is, is greater than 0x10000 and the carry bit occurs, update with the lower 16bits value ignored the carry bit.
4. Order RECV command is for notifying the updated Sn\_RX\_RD to W5500.

In case of 2048(0x0800) in S0\_RX\_RD,

0x0028	0x0029
0x08	0x00

Sn\_RX\_WR is initialized by OPEN command and it is auto-increased by the data reception.

If the increased value exceeds the maximum value 0xFFFF, (greater than 0x10000 and the carry bit occurs), then the carry bit is ignored and will automatically update with the lower 16bits value.

In case of 2048(0x0800) in S0\_RX\_WR,

0x002A	0x002B
0x08	0x00

Sn\_IMR masks the interrupt of Socket n. Each bit corresponds to each bit of Sn\_IR. When a Socket n Interrupt is occurred and the corresponding bit of Sn\_IMR is '1', the corresponding bit of Sn\_IR becomes '1'.

When both the corresponding bit of Sn\_IMR and Sn\_IR are '1' and the n-th bit of IR is '1', Host is interrupted by asserted INTn PIN to low.

7	6	5	4	3	2	1	0
Reserved	Reserved	Reserved	SEND_OK	TIMEOUT	RECV	DISCON	CON

7~5	Reserved	Reserved
4	SENDOK	Sn_IR(SENDOK) Interrupt Mask
3	TIMEOUT	Sn_IR(TIMEOUT) Interrupt Mask
2	RECV	Sn_IR(RECV) Interrupt Mask
1	DISCON	Sn_IR(DISCON) Interrupt Mask
0	CON	Sn_IR(CON) Interrupt Mask

Sn\_FRAG configures the FRAG(Fragment field in IP header).

Sn\_FRAG0 = 0x0000 (Don't Fragment)

0x002D	0x002E
0x00	0x00

Sn\_KPALVTR configures the transmitting timer of 'KEEP ALIVE(KA)' packet of SOCKETn. It is valid only in TCP mode, and ignored in other modes. The time unit is 5s.

KA packet is transmittable after Sn\_SR is changed to SOCK\_ESTABLISHED and after the data is transmitted or received to/from a peer at least once.

In case of 'Sn\_KPALVTR > 0', W5500 automatically transmits KA packet after time-period for checking the TCP connection (Auto-keepalive-process).

In case of 'Sn\_KPALVTR = 0', Auto-keep-alive-process will not operate, and KA packet can be transmitted by SEND\_KEEP command by the host (Manual-keep-alive-process). Manual-keep-alive-process is ignored in case of 'Sn\_KPALVTR > 0'.

Sn\_KPALVTR = 10 (Keep Alive packet will be transmitted every 50 seconds.)

<sup>5</sup> Theoretical Guaranteed Speed

Even though theoretical design speed is 80MHz, the signal in the high speed may be distorted because of the circuit crosstalk and the length of the signal line. The minimum guaranteed speed of the SCLK is 33.3 MHz which was tested and measured with the stable waveform.

Please refer to the SPI Application Note which shows the WIZnet test environment and results.

<sup>6</sup> 2.1ns is when pn loaded with 30pF. The time is shorter with lower capacitance.

## 5.5.5 Transformer Characteristics

Turn Ratio	1:1	1:1
Inductance	350 uH	350 uH

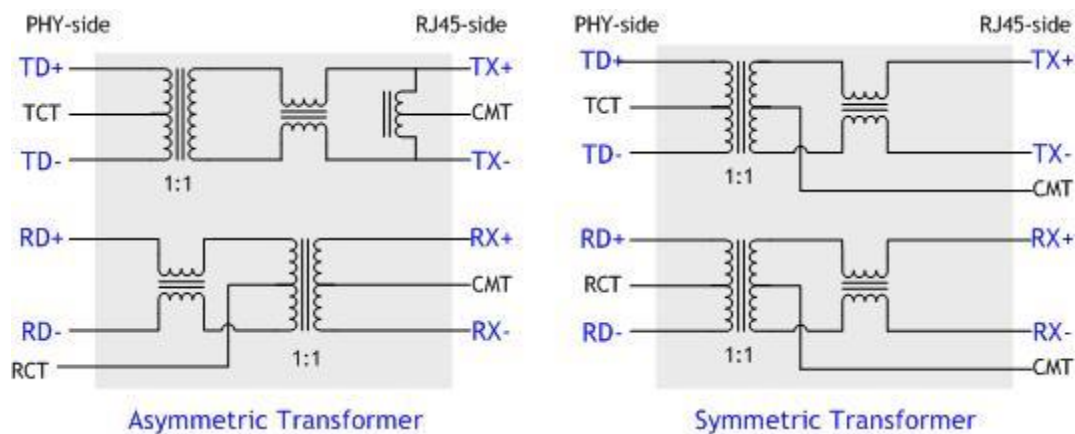

Figure 24. Transformer Type

## 5.5.6 MDIX

W5500 does not support auto-MDIX feature.

Thus, user should use straight-through cables to connect to other switches or routers and crossover cables to connect to devices such as servers, workstations or another W5500. However, user can use either type of cable to connect to other devices with auto-MDIX enabled, and the interface automatically corrects for any incorrect cabling.

## 6 IR Reflow Temperature Profile (Lead-Free)

Moisture Sensitivity Level : 3

Dry Pack Required: Yes

Average Ramp-Up Rate ( $T_{s_{max}}$ to $T_p$ )	3 ° C/second max.
Preheat <ul style="list-style-type: none"> <li>- Temperature Min (<math>T_{s_{min}}</math>)</li> <li>- Temperature Max (<math>T_{s_{max}}</math>)</li> <li>- Time (<math>t_{s_{min}}</math> to <math>t_{s_{max}}</math>)</li> </ul>	150 °C 200 °C 60-120 seconds
Time maintained above: <ul style="list-style-type: none"> <li>- Temperature (<math>T_L</math>)</li> <li>- Time (<math>t_L</math>)</li> </ul>	217 °C 60-150 seconds
Peak/Classification Temperature ( $T_p$ )	265 + 0/-5 °C
Time within 5 °C of actual Peak Temperature ( $t_p$ )	30 seconds
Ramp-Down Rate	6 ° C/second max.
Time 25 °C to Peak Temperature	8 minutes max.

## Document History Information

Ver. 1.0.0	1AUG2013	Initial Release
Ver. 1.0.1	13SEP2013	Corrected duplicated statements and typing errors (P.14, 23, 24, 28, 39, 51) Corrected descriptions (P.35)
Ver. 1.0.2	14NOV2013	Changed <b>at 1.1 Pin Descriptions</b> from It must be tied to GND to NC(PIN38~42) 2. Corrected typing error : from 0x02 to 0x42 value of SOCK_MACRAW at 4.2 Socket Registers
Ver. 1.0.3	29MAY2014	1. Corrected <b>.2 Socket Register</b> wrong descriptions of Sn_MSSR about FMTU/MTU
Ver. 1.0.4	13JUN2014	1. Added Note about reading size register value 2. Added IR Reflow Temperature Profile
Ver. 1.0.5	10NOV2014	1. Added description for MISO pin The SCSn signal defines MISO pin output value. 2. Modified the register notation <b>Modified the register notation “ Socket Register”</b> from [R] to [RCW1] 3. Corrected typing error: from DICON to DISCON of Sn_SR at 4.2 Socket Register
Ver. 1.0.6	30DEC2014	1. Corrected typing error : from 0x02 to 0x42 value of SOCK_MACRAW “ ”
Ver. 1.0.7	24FEB2016	1. Corrected $I_{AWT}$ (Interrupt Assert Wait Time) 2. Notice the information of $PLL_{clk}^3$
Ver. 1.0.8	19MAY2017	1. Corrected Driver Level Range Unit uW/MHz to uW (5.5.3 Crystal Characteristics)
