Appendix 1  Circuit Diagram
1. **About this document**

   This document concerns the E-blocks PICmicro Multiprogrammer code EB006 version 4.

   The order code for this product is EB006.

1. **Trademarks and copyright**

   PIC and PICmicro are registered trademarks of Arizona Microchip Inc.
   E-blocks is a trademark of Matrix Multimedia Limited.

2. **Other sources of information**

   There are various other documents and sources that you may find useful:

   - **Getting started with E-Blocks.pdf**
     This describes the E-blocks system and how it can be used to develop complete systems for learning electronics and for PICmicro programming.

   - **PPP Help file**
     This describes the PPP software and its functionality. PPP software is used for transferring hex code to a PICmicro microcontroller.

   - **C and assembly strategies**
     Not provided for this product.

3. **Disclaimer**

   The information in this document is correct at the time of going to press. Matrix Multimedia reserves the right to change specifications from time to time. This product is for development purposes only and should not be used for any life-critical application.

4. **Technical support**

   If you have any problems operating this product then please refer to the troubleshooting section of this document first. You will find the latest software updates, FAQs and other information on our web site: [www.matrixmultimedia.com](http://www.matrixmultimedia.com). If you still have problems please email us at: support@matrixmultimedia.co.uk.
2. General information

1. Description
   This new PICmicro microcontroller programmer connects to your PC via USB to provide you with one of the
   world’s lowest cost and most flexible PICmicro microcontroller programmers. This board can be used with
   Assembly, C or Flowcode programming utilities provided by Matrix Multimedia. The board will program most 8,
   14, 18, 28 and 40 pin flash PICmicro microcontroller devices using the flexible programming software provided –
   PPP - and provides ‘clean’ access to all I/O lines on the relevant PICmicro MCU devices.

2. Features
   • E-blocks compatible
   • Low cost
   • Used as a programmer and as a development board
   • Programs a wide range of PICmicro MCU devices
   • Full suite of programming software available
   • RC or Xtal operation
   • 5 I/O ports
   • In-Circuit Debugging via MPLAB® ICD2

3. New features for Version 5
   The following are the improvements made on version 5:
   • The board can now accept power supplies of either polarity – positive inner or positive outer.
   • The board is now compatible with a wider range of PICmicros for Low Voltage Programming which use B3, 4
     or 5 for the LVF pin.
   • The USB control chip on board is now much faster and can program at the rate of 1k byte per second.
   • PPP has also been improved inline with these changes.
4. **Block schematic**

![Block schematic diagram]

5. **Supported devices**

Currently PPP and the EB006 support the following devices:

PIC12F629, PIC12F675, PIC12F635, PIC12F683

PIC18F242, PIC18F248, PIC18F252, PIC18F256, PIC18F442, PIC18F458, PIC18F458, PIC18F1220, PIC18F1320, PIC18F2220, PIC18F2320, PIC18F2321, PIC18F2410, PIC18F2420, PIC18F2431, PIC18F2439, PIC18F2455, PIC18F2510, PIC18F2515, PIC18F2520, PIC18F2525, PIC18F2539, PIC18F2550, PIC18F2585, PIC18F2586, PIC18F2610, PIC18F2620, PIC18F2680, PIC18F2681, PIC18F2620, PIC18F4330, PIC18F4331, PIC18F4410, PIC18F4420, PIC18F4431, PIC18F4439, PIC18F4455, PIC18F4510, PIC18F4515, PIC18F4520, PIC18F4525, PIC18F4539, PIC18F4550, PIC18F4585, PIC18F4586, PIC18F4610, PIC18F4620, PIC18F4680, PIC18F4681
3. Board layout

1. Power connector - either polarity
2. USB connector
3. Reset switch
4. Port E I/O
5. Port A I/O
6. Port B I/O
7. Port C I/O
8. Port D I/O
9. RC clock speed potentiometer
10. RC clock speed switch
11. Clock crystal / RC switch
12. ICD2 socket
13. Power screw terminals
14. USB/ICD2 programming selector
15. USB/ICD2 power selector
16. Removable crystal
17. USB control chip – do not remove
18. Low Voltage Program pin selector link block
19. Expansion connector – two off
20. Turned pin DIL sockets for 8, 14, 18, 28, 40 pin PICmicro devices
21. ‘Ready to go’ programming LED
22. Power LED
4. **Testing this product**

The following program will test the circuit. The test file can be downloaded from [www.matrixmultimedia.com](http://www.matrixmultimedia.com).

1. **installing PPP**

To install run PPPv3.exe, which is located at `<D>:\PPPv3\PPPv3.exe` and follow the instructions provided. `<D>` refers to your CD drive.

By default PPPv3 is installed into:

C:\Program Files\Matrix Multimedia\Common\PPPv3\

There are four ‘Features’ that can be installed.

- PPP v3 core files - this is PPP v3 itself, and should be installed.
- Update ASM4PICs - This feature allows you to update ASM4PICs to use PPP v3.
- Update C4PICs - This feature allows you to update C4PICs to use PPP v3.
- Update Flowcode - This feature allows you to update Flowcode to use PPP v3.

The three updates will be automatically installed. Select the ‘X’ ‘Do not install option’ if you do not to update a feature.

If you need to update a product at a later date you can re-run the install and update that feature.

There is more help and information available on the CD provided at `<D>:\PPPv3\readme.txt`

`<D>` refers to your CD drive.

When you connect the Multiprogrammer to your computer, via the USB cable, the first time there will be an installation routine for this ‘new hardware’. This for most users will be a ‘plug and play’ routine where your computer will automatically recognize the hardware.

**Running on Windows 2000 / ME / XP**

These programs allow ‘plug and play’ for your new hardware. Therefore when you first connect the Multiprogrammer to your computer you will receive a pop-up screen that indicates that there is new hardware connected to the computer. The program itself will deal with any installation of any drivers that it requires internally. Therefore you can use your Multiprogrammer immediately.

**Running on Windows 98 (you will need the Windows 98 CD at hand)**

When you connect the Multiprogrammer to the computer your Windows 98 program will run a ‘New Hardware Wizard’. This procedure is straightforward and easy to understand. Follow the on-screen instructions. Once this has been completed the Mulitprogrammer will be ready to use.

There is more detailed information and help on the CD provided at `<D>:\eblocks\Installation Guide.doc`

2. **Testing the board – with an external power supply**

   1) Ensure power is supplied to the Multiprogrammer board
      1. USB cable required
      2. PSU cable required
   2) Set Jumper J29 to ‘PSU
   3) Ensure Jumper J12-14 set to USB
   4) RC mode (SW2 towards the EDGE of the board)
   5) FAST mode (SW1 towards the CENTRE of the board)
   6) Insert EB-004 LED Board into Port B (and Port A if extra LED Board available)
   7) Program the a PIC16F88 with the test program RC_LVP.hex found in the directory `<D>:\E-Blocks\EB006 Multiprogrammer\RC_LVP.hex`
8) Check the illumination of all LEDs
9) Note that LB3 will not illuminate due to the fact that the program sets the PICmicro into Low Voltage Programming mode

2. Testing the board – with an USB power supply

The following instructions explain the steps to test and use your PICmicro® Multiprogrammer Board in low voltage programming mode. Microchip® have enabled this feature in some devices however it has some adverse effects on the architecture of the PIC chips.

Follow these instructions to program the PICmicro Multiprogrammer Board in Low Voltage Programming (LVP) mode.

**Hardware Set-up**

1) Set Jumper J29 to appropriate position
2) Right hand side labelled ‘USB’
3) Ensure Jumper J12-14 set to USB (Right hand side)
4) Ensure power is supplied to the Multiprogrammer board via the USB cable being inserted into socket (J1) (no need for external power supply)

**Software Set-up**

5) Enter the configuration screen of PPP
6) Click on “Switch to expert config screen”
7) Select the target chip for your design.
8) The configure set-up should be as follows:

```
<table>
<thead>
<tr>
<th>Oscillator Selection</th>
<th>HS</th>
</tr>
</thead>
<tbody>
<tr>
<td>Watchdog Timer</td>
<td>Off</td>
</tr>
<tr>
<td>Power Up Timer</td>
<td>Off</td>
</tr>
<tr>
<td>RA5/MCLR Pin Function Select</td>
<td>MCLR</td>
</tr>
<tr>
<td>Brown Out Detect</td>
<td>Off</td>
</tr>
<tr>
<td>Low Voltage Program</td>
<td>Enabled</td>
</tr>
<tr>
<td>Data EE Reed Protect</td>
<td>Off</td>
</tr>
<tr>
<td>Flash Program Write Enable</td>
<td>Write Protect Off</td>
</tr>
<tr>
<td>Background Debug</td>
<td>Disabled</td>
</tr>
<tr>
<td>CCPI Mux pin</td>
<td>RB0</td>
</tr>
<tr>
<td>Code Protect</td>
<td>Off</td>
</tr>
<tr>
<td>Fail-Safe Clock Monitor Enable</td>
<td>Disabled</td>
</tr>
<tr>
<td>Internal External Switch Over Mode</td>
<td>Disabled</td>
</tr>
</tbody>
</table>
```

9) **Ensure “Low Voltage Program” is ENABLED**
10) The only changes that might be required on your design are the “Oscillator Selection” (HS, XT and EXTRC) and the “Watchdog Timer” (generally off is best).
11) Once these have been set the board as stated the software is configured correctly
12) (See specific PICmicro® datasheet for more information regarding the configuration modes)
13) Click “ok” to return to programming section of PPP.
14) Send program to the chip
15) These instructions depend on the program that you are using. See relevant program (Flowcode, PPP ect.) help file for more information
Note
If the chip has been set to high voltage programming then the board will require a high voltage to re-enable the LVP. This must be done before attempting to program in LVP – however when shipped the chip is already configured in LVP.

3. Important information regarding LVP
When using LVP, bit 3 of Port B is not functional as it is part of the LVP programming architecture set by Microchip®. This should be noted as it may have an effect on the program that you write. For example the LCD Board (EB-005) using bit 3 and therefore will not operate as predicted. You will need to make the appropriate jumper selection on J11,16,17 for Low Voltage Programming.

4. Trouble shooting for Low Voltage Programming
Due to the internal architecture of the Microchip® PICmicros a high voltage is needed to re-enable Low Voltage Programming (LVP) mode. The following instructions indicate how to tell if the chip is not in LVP mode and how to re-enable this feature.

Indicating if the PICmicro is in LVP mode or not
If LVP is disabled the programming software PPP will not be able to ID the on board PICmicro. A similar pop-up screen will appear:

![Matrix PICmicro Programmer](image)

Then the PPP will indicate that the chip has not been erased. There is no point in continue to try to program the PICmicro.

Re-Enabling the LVP function
This requires the use of an +13.5V external power supply (see Section 6 for details). In order to re-enable the PICmicro must be erased. This erase function returns the PICmicro to the factory settings and thus LVP is enabled.

To Erase the PICmicro to enable LVP mode following these instructions:

16) Remove all power supplies to the board
17) Remove USB cable from socket (J1)
18) Remove external power supply from socket (J6)
19) Place jumper J29 to ‘PSU’ (left-hand side)
20) Insert USB cable into socket (J1)
21) Insert +13.5V power supply via socket (J6)
22) In PPP click File -> Erase PICmicro
23) Note this cannot be done directly from Flowcode

The PICmicro will now be enabled for LVP.

Please see section 5.4 for instruction on Low Voltage Programming.
5. Circuit description

The Multiprogammer solution is made up of two parts: A circuit board that allows various slave PICmicro devices to be programmed, and the program to be executed ‘seamlessly’, and the Windows based programming utility ‘PPP’.

1. Power Supply

The board is normally operated from a regulated DC supply of 13.5V. This allows full operation including programming.

The board can be operated in Low-voltage mode via solely the USB cable provided. However care must be taken, as there is only limited power that can be taken from a computers USB port. Also only certain chips can be reprogrammed in this Low-voltage mode, refer to the specific chip datasheet to determine if it has LVP function. The PIC16F88 provided with this board has been set-up to accept low-voltage programming (LVP), but some features are not available in this mode, such as I/O line B3. If this mode is disabled then the 13.5V regulated DC power supply must be used, and only using this high-voltage programming can the low-voltage programming mode be re-enabled. Please refer to the specific PIC datasheet regarding LVP function.

Please note that not all chips have the Low-Voltage Programming function and therefore these chips must be programmed using an external power supply as stated above.

The jumper link system, J29, allows the user to decide on the source of the power supply. If using a regulated 13.5V power supply the jumper should be positioned to the left hand side of the jumper system labelled ‘PSU’. If using USB power place the jumper on the right hand side of the jumper system. The jumper should always be orientated so that the 3 links in the jumper block are always position horizontally – thus connecting the centre pins to either the left hand or right hand pins. LED2 indicates that power is supplied to the board from either the external power supply or the USB cable.

Please note that both USB and the PSU cables should be removed for the Multiprogammer board BEFORE changing the position of this jumper.

When using the 13.5V regulated power supply the board will only supply up to 350mA. This is due to the thermal dynamics of the on board regulator. Therefore if more current is required a heat sink must be applied. The heat sink characteristics will determine the amount of power that can be dissipated and therefore will affect the amount of current available.

Please note that Matrix Multimedia HPPUS power supplies will supply UPTO 600mA.

Remember that other E-blocks will have to receive 5V by placing a connecting wire from the “+V Out” screw terminal of the Multiprogammer to the “+V” screw terminal of each E-Block that requires a voltage.

2. Programming circuit

The Multiprogammer connects to a personal computer via the USB socket. Any USB socket on the PC can be used. The host PIC16C745 microcontroller is used to communicate between the USB bus and the Multiprogammer circuitry. The PIC16C745 is connected to a network of analogue switches formed by U3 and U4. These devices route 0V, 5V and Vpp to appropriate pins on the slave PICmicro devices as and when necessary.

The ‘ready to go’ indicator LED 1 connects to the host PIC16C745. The ‘745 has an on-board A/D converter that detects the level of the supply voltage. LED 1 is used to indicate that the host PIC16C745 is communicating with the PC and that the connection with the PC is valid.

3. DIL Sockets and I/O Ports

The slave PICmicro DIL sockets are wired in parallel (see table of connections below) and the ports are fed out to 5 D-type sockets grouped in ports. These signals are also available on a 40-way header (J5) for expansion purposes. Other important signals can be accessed via the other expansion header J24 (see table of connections below). Some
ports are only partially complete – Port A has only 5 connections, and Port E has only 3 connections. This reflects the pin outs of the various PICmicro devices themselves. When using an 8-pin device it should be placed in the upper 8 pins of the 14-pin DIL socket. Please refer to device datasheets for availability of port outputs on each device.

NOTE
RA4 on many PICmicro devices has an open collector output. This means that you will most likely need a pull up resistor to be able to detect a change in status. Please see the datasheet on the device you are using for further details.

4. Reset Push Button
PB1 provides a reset by pulling the MCLR pin low. Note that the PIC16C745 will reset the slave PICmicro as part of the send routine so that you do not need to press this switch each time you send your program to the board.

5. Frequency Selection
The clock signal for this board can be either from the RC network or by the Crystal. SW2 dictates whether an RC circuit or a crystal circuit is used on the slave PICmicro device. SW1 dictates whether a fast or slow RC network is used and in this mode RV1 will allow you to vary the oscillator speed. By default the board is fitted with a 19.6608MHz crystal. The crystal fits into a small socket, which allows the crystal to be easily changed. For Matrix Multimedia courses a 3.2768MHz crystal is recommended. These frequencies are chosen as they divide down by PICmicro prescalers to give suitable frequencies for clock systems and for facilitating serial communication using standard baud rates.

6. In-Circuit Debugging
The Multiprogrammer board has a connection to allow the user to connect the Microchip® MPLAB® ICD2. This allows the user to run the software that is running on the actual hardware. The ICD2 allows the user to step through the actual program whilst it interacts with the hardware. Full information on the MPLAB® ICD2 can be found on the Microchip website at www.microchip.com

To use the In-Circuit Debugger, remove the power supply and the USB cable to the Multiprogrammer. Then place the 3-way jumper link associated with J11-13 to the left hand side of the 3 x 3 header pins. This is labelled ‘ICD2’. Then simply connect the ICD2 cable into the Multiprogrammer via socket J15 and the user can then use the full functions of the MPLAB® ICD2 In-Circuit Debugger.

7. Low voltage programming
Many PICmicros have a low voltage programming mode where it is possible to program the device without the need for a 12V supply line. The difficulty here is that different families of PICmicro devices use different pins as the Low Voltage programming pin. B3 is predominantly used for this function but B4 and B5 are also used on some devices. These links are all in the left hand position when B3, 4, 5 are used as I/O lines. To program the PIC16F88 in LVP mode then J11 should be in the right hand position and B3 will not be usable as an I/O line.
6. PICmicro microcontroller pin out details

Broadly speaking the ranges of PICmicro devices are designed to be upwards compatible: the pin functions on an 18-pin device are available on a 28-pin device and a 40-pin device. This can be seen from the following excerpt from the Microchip product selector card. The following diagram shows the pin out of the various PICmicro devices:

Note that GP0 maps to RB7
GP1 maps to RB6
GP2/AN0 maps to RA0/AN0

7. **Bus connections**

1. **Expansion bus**

The pin connections on the expansion bus exactly mirror the pin numbering on the 40-pin DIL socket. Note that the pin numbering on the IDC socket is slightly different to that on a DIL socket which results in the seemingly odd arrangement of pins on the IDC pin chart.

</table>

For the 18, 28, and 40 pin devices the buses on devices are largely upwards compatible – pin connections on an 18-pin device appear on a 28-pin device and a 40-pin device, and pins on a 28-pin device appear on a 40-pin device. This allows the 18, 28, and 40 pin DIL sockets to be connected in parallel with the PICmicro bus structure intact.

* This parallel connection is not possible with 8 and 14 pin devices due to programming requirements which means that there are anomalies with the pin connections for the 8 and 14 pin devices as follows:
